

Partnerships to advance medical discoveries

Sanguine

Our Mission

At Sanguine, our mission is to bridge the gap between donor biospecimens and researchers to accelerate therapeutic discovery. Researchers need access to samples from people with diagnosed conditions to better understand disease and ultimately develop therapeutics. Sanguine identifies individuals who meet the criteria for the active research study, acquires informed consent, and collects the samples.

2000+ Completed Studies

100+ Nonprofit Organization Partnership 70,000+

Our Donors

Our donor network is 70,000 and growing, spanning from healthy individuals to people with the rarest diseases across all demographics. We strive to lower the barrier to participate in research with ease and transparency, including the majority of sample collection taking place in the donor's home. We collect blood products from blood draws and apheresis, non-blood blood products such as nasal mucosa, saliva, urine, and stool, and integumeatray tissues including fingernails, hair, and skin.

Blood Derived Biofluids and Products

Non-Blood Dervived Biofluids

Integumentary Tissues

Our Partnerships

Although we have an extensive donor network, we are continually growing and often partner with foundations, advocacy groups, and other non-profit organizations to reach the most eligible participants for the research we support.

Success story –

Study: A large pharmaceutical company needed whole blood samples from people diagnosed with giant cell arteritis or large vessel vasculitis. There were some complex inclusion and exclusion criteria which made identifying qualified donors a challenge.

Partnership: Sanguine partnered with the Vasculitis Foundation to engage members of their community. Sanguine provided IRB-approved content for the foundation to share through their social media channels and monthly support group meeting announcements.

VASCULITIS FOUNDATION:
